

# Sprint 22

Sprint Retrospective:

Notes:

asynchronous

What went right:

- Refactor map/pins code based on code review notes and this weeks office hours. Get reputation peer review out. - Ghabe
- Worked on code for frontend Alert feature - Josh
- Managed to get 30 minutes of work done each day, following my action plan. I dont know how much of an effect it had on my doing my actual work. I thought using figma was pretty easy and fun. - Frank
- Worked as much as I could on the task items I listed on the sprint planning - Rhoy
- Able to roll out complete rough drafts for both success and failure cases and figma views. - Joseph
- Was able to research file upload and create drafts of diagrams - David

What went wrong:

- Should have finished peer review before this sprint but needed to be extended by two days. - Ghabe
- Still need to integrate into main. Felt like I didn't make full use of the 17 hours I wanted for the sprint. I didn't want to be working on the feature until the last day but still am. - Josh
- I may have to take extra days to finish my designs. This is a problem with my procrastination, the problem is that even though I took those 30 minutes each day to do work it was still not enough to get more work done before the weekend. It wasn't written but I was supposed to improve our burndown charts, I didn't get around to it yet. - Frank
- Feels like I spent a lot of time trying to do work for my feature but I didn't produce as much work as I would like - Rhoy

- I feel that if I were to give my "final" draft on the events LLD today it wouldn't be perfect the way I want and feels rushed. As a result, I am in conflict if to take in one more day to review or would it be an issue to reach peer review / team review deadline - Joseph
- realized there might be some performance issues with my design so I want to ask the professor for advice - David

#### Action plan:

- Not take multiple tasks that's needed to be done on the same sprint. To avoid situations like last sprint where I need to finish my code for code review demo and make a thorough peer review. Which resulted in the peer review getting extended two days. - Ghabe
- I want to try to document work like Frank so that I have a better idea on how much work is getting done daily. - Josh
- Seeing as my reluctance is high to get work done early, I think that I should up my time to be 1.5 hours of work before 5 pm each day. I am not sure if all work is going to be productive but it could help complete tasks sooner in the sprint. This would improve the completeness trend on the graph. I would hope that the graph gets 0% this next sprint as we need everything to be prepared. - Frank
- Since my class schedule is more towards noon-evening. I will implement more in the morning and try to produce at least 2 hours of actual work done before classes - Rhoy
- Based on my capacity for next week I can afford to take on extra hours and since this is an app specific, I will just push my design one more day - Joseph
- Will need to take an extra day on designing and add the unfinished workload to next sprint, so I will have to increase my capacity to 12 hours to keep up with the extra work - David
